

NON-INTRUSIVE INSPECTION (NII)

When safety is paramount, ARI can deliver Non-Intrusive Inspection services which eliminate confined space entry, provide asset reliability assurance and require no loss of production.

SOLUTION

ARI can provide non-intrusive inspection services which deliver a full asset compliance report without the need for confined space entry or loss of production.

In combination with an initial desktop engineering review and the utilisation of advanced inspection equipment, ARI can inspect your pressure vessel or pressure equipment via phased array ultrasonics, time of flight diffraction, conventional thickness inspection and surface methods to provide an inspection outcome which substitutes the need for a vessel outage or vessel entry. NII inspections conducted by experienced ARI technicians can be completed without the requirement for scaffolding and at vessel operating temperatures in excess of 100°C.

ARI inspection results can be further reviewed by our inspection engineers to produce a code and regulatory compliant fitness for service statement.

DELIVERY

ARI can deliver NII services to pressure equipment of any size. Our portable inspection equipment and personnel are available Australia wide.

FURTHER INFORMATION

For further information of how ARI can reduce personnel safety risk, eliminate downtime and provide results that matter, contact:
